                                                                                                                                                                                 NOTE: This is a 'working draft' sequence. It currently consists of 47 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 iomo sapiens

                                  * NOTE: This is a 'working draft' sequence. It currently consists of 5 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Submitted (08-MAR-2000) whitehead Institute/MIT Center for Research, 320 Charles Street, Cambridge, MA 02141, USA On Jun 3, 2000 this sequence version replaced gi:7670170. All repeats were identified using RepeatMasker: Smit, A.F.A. & Green, P. (1996-1997)

* NOTE: This is a 'working draft' sequence. It currently
* consists of 7 contigs. Gaps between the contigs
* are represented as runs of N. The order of the pieces
* is believed to be correct as given, however the sizes
* of the gaps between them are based on estimates that have
* movided by the submittor.
       * This sequence will be replaced

* the finished sequence as soon as it is available and

* the accession number will be preserved.

**NOTE: This is a 'working draft' sequence. It currently
**consists of 33 contigs. The true order of the pieces
** is not known and their order in this sequence record is
** arbitrary. Gaps between the contigs are represented as
** runs of N. but the exact sizes of the gaps are unknown.
** This record will be updated with the finished sequence
** as soon as it is available and the accession number will
** be preserved.
** 1358. Contign of 1358 be in leasth

* NOTE: This is a 'working draft' sequence. It currently
* consists of 47 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
* be preserved. Summary Statistics

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Submitted (01-SEP-1999) Genoscope - Centre National de Sequencage : CP 5706 91057 EVRY Cedex - FRANCE (E-mail : segref@genoscope.cns.fr - Web : www.genoscope.cns.fr)
The cDNA library to be analyzed within the framework of this project was created using a Botrytis cinerea strain which was grown under conditions of nitrogen deprivation, which is the normal situation for B. cinerea during its development on its host plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Eukaryota; Fungi; Ascomycota; Pezizomycotina; Leotiomycetes Helotiales; Sclerotiniaceae; Botryotinia.

                                                                                                                                                                                                                                                                                                                                                                                                A composite nucleotide sequence (AAT42752) and putative translation (AAW08144) sequence are provided of a motif that is found spliced to a proportion of chicken CHD-1A clones. The motif is inserted between bases 4327 and 4328 of the CHD-1A composite sequence (AAT42751). None of the 7 CHD-1 clones examined contained the complete motif. There are no splice donor or acceptor sites within the motif suggesting it is a final rather than an intermediary product of splicing. The motif is also found at the 3' end of the CHD-W clone CC14 (see also AAT42753).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Percent Similarity:
                                                                                The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           splicing.                                                                                                                                                                                                                                        The invention relates to novel genes (AAH68727-AAH73383) associated with cervical cancer with cytostatic activity. The nucleic acids and encoded polypeptides are useful: to assess if a patient is afflicted with cervical cancer or has a pre-malignant condition; to monitor the progression of cervical cancer or a premalignant condition in a patient; and to select and/or assess the efficacy of a compound or therapy for inhibiting cervical cancer in a patient. The nucleic acids may also be useful for gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             04-FEB-2000; 2000US-0180312; 26-MAY-2000; 2000US-00207456; 30-JUN-2000; 2000US-0608408; 03-AUG-2000; 2000US-0632366; 21-SEP-2000; 2000US-0234687; 27-SEP-2000; 2000US-0234535; 04-OCT-2000; 2000GB-0024263;
                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention. For this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            measuring human gene expression in a sample derived from human heart present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derifrom the human heart via microarrays. By measuring gene expression, probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular seg. cardiovascular disease, hypertension, cardiac arrhythmias and

They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is one of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the valor int/pub/published_pct_sequences.

The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI;

The nucleic acids and encoded polypeptides are useful: to assess if a patient is affilicted with cervical cancer or has a per-malignant condition; to monitor the progression of cervical cancer or a pre-malignant condition in a patient; and to select and/or assess the efficacy of a compound or therapy for inhibiting cervical cancer in a patient. The nucleic acids may also be

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to novel genes (AAH68727-AAH73383) associated with cervical cancer with cytostatic activity. The nucleic acids and encoded polypeptides are useful: to assess if a patient is afflicted with cervical cancer or has a pre-malignant condition; to monitor the progression of cervical cancer or a premalignant condition in a patient; and to select and/or assess the efficacy of a compound or therapy for inhibiting cervical cancer in a patient. The nucleic acids may also be useful for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal
                                                                                                                                   Penn

 measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system

 The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the

Submitted (23-NOV-2001) Whitehead Institute/MIT Center for Genome Research, 320 Charles Street, Cambridge, MA 02141, USA All repeats were identified using RepeatMasker:

Smit, A.F.A. & Green, P. (1996-1997)
http://ftp.genome.washington.edu/RW/RepeatMasker.html
 * arbitrary Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will the preserved.
 * NOTE: This record contains 67 individual

* sequencing reads that have not been assembled into

* contigs. Runs of N are used to separate the reads

* contigs. Runs of N are used to separate the reads

* and the order in which they appear is completely

 Submitted (16-JAN-2000) Whitehead Institute/MIT Center for Genome Research, 320 Charles Street, Cambridge, MA 02141, USA On Sep 10, 2000 this sequence version replaced gi:7407963. All repeats were identified using RepeatMasker: Smit, A.F.A. & Green, P. (1996-1997) http://fry.genome.washington.edu/RM/RepeatMasker.html Genome Center
 * NOTE: This is a 'working draft' sequence. It currently consists of 10 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Trypanosoma
IN PROGRESS
 Consensus quality: 139128 bases at least Q40
Consensus quality: 142556 bases at least Q30
Consensus quality: 143744 bases at least Q20
Estimated insert size: 148000; pulse field gel estimation
Estimated insert size: 145059; sum-of-contigs estimation
Quality coverage: 6.27 in Q20 bases; punse field gel estimation
Quality coverage: 6.4 in Q20 bases; sum-of-contigs estimation.
* NOTE: This is a 'working draft' sequence. It currently
* consists of 7 contigs. Gaps between the contigs
* are represented as runs of N. The order of the pieces
* is believed to be correct as given, however the sizes
* of the gaps between them are based on estimates that have

 Consensus quality: 157767 bases at least 040
Consensus quality: 180259 bases at least 020
Consensus quality: 180259 bases at least 020
Consensus quality: 1804175 bases at least 020
Estimated insert size: 20450; agarose-fp estimation
Quality coverage: 5.79 in 020 bases; sum-of-contigs estimation
Quality coverage: 5.79 in 020 bases; sum-of-contigs estimation.
**NOTE: This is a "working draft' sequence. It currently
**consists of 33 contigs. The true order of the places
**Is not known and their order in this sequence record is
**arbitrary. Gaps between the contigs are represented as
**runs of N, but the exact sizes of the gaps are unknown.
**This record will be updated with the finished sequence
**as soon as it is available and the accession number will
**be preserved.

 A composite nucleotide sequence (AAT42752) and putative translation (AAW08144) sequence are provided of a motif that is found spliced to a proportion of chicken CHD-1A clones. The motif is inserted between bases 4327 and 4328 of the CHD-1A composite sequence (AAT42751). None of the 7 CHD-1 clones examined contained the complete motif. There are no splice donor or acceptor sites within the motif suggesting it is a final rather than an intermediary product of splicing. The motif is also found at the 3' end of the CHD-W clone CC14 (see also AAT42753).

The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (antipagonists are useful in the diagnosis, treatment and prevention of; (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone
 Nucleic acids encoding 3224 human useful for preventing, diagnosing cancers and metastases .

 Note: The sequence data for this patent did not form printed specification, but was obtained in electronic from WIPO at ftp.wipo.int/pub/published_pct_sequences.
 purified amplified products were cloned into the mammalian expression plasmid VR1050 to produce DNA vaccines for immunisation. Blood and sera obtained from groups of mice immunised with doses of vaccine was used to identify stage specific expression of Rifin protein by immunofluorescent antibody testing. The method is useful for determination of subcellular localisation of proteins and for the development of antimicrobial

 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

 cancer associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of coloractial carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the
 present invention.

 The present invention describes proteins and their fragments (I) encoded CD by chromosome 2 of the human malarial parasite, plasmodium falciparum. CC Also described are: (I) nucleotide sequences (II) encoding (I): and (2) CC vaccines against P. falciparum infection comprising (I) or (II). CC (I) and (II) are useful for the development of vaccines against P. falciparum infection of and polyclonal antisers or a monoclonal CC antibody raised to immunogens comprising the sequences of (I), are CC useful in the detection of infection with P. falciparum. Furthermore, CC (I) (especially when they are rifins or secreted or membrane proteins) CC can aid the identification of drugs to treat or prevent P. falciparum CC infection, or they can be used to identify drug resistance in CC subsequent identification of proteins encoded by it will help to expand CC our understanding of parasite biology, a process hampered by the CC subsequent identification for the plasmodium chromosome 2 and the subsequent identification of proteins encoded by it will help to expand CC our understanding of parasite biology, a process hampered by the CC parts and drug development. Parasite resistance to drugs and mosquito CC resistance to insecticides have led to a resurgence of malaria in many CC parts of the world, and there is a pressing need for vaccines and new CC drugs. AAA70078 to AAA70287 and AAB18144 to AAB18352 represent nucleotide CC and protein sequences given in the present invention, but which are not xx

 Direct Submission
 NOTE: This record contains 77 individual sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone
 will be sequenced to completion. In the event that

 Direct Submission
 NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

NOTE: This is a 'vorking draft' sequence. It currently consists of 66 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown.

This record will be updated with the finished sequence
 as soon as it
be preserved

Direct Submission
Submitted (05-JUL-2000) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
On Jan 29, 2002 this sequence version replaced gi:14717253.
 Assembly p
 NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

NOTE: This is a 'working draft' sequence. It currently consists of 4 contigs. The true order of the places is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will
 be preserved

 recombinations with endogenous retroviral sequences and a cellular oncogene. The position of the oncogene junction was determined to be in the gag gene for pl0 at a position that removed the terminal 24 gag-encoded amino acids. The gag-onc fusion protein appears to be responsible for fibroblast and pre-B cell transformation. The authors call this oncogene y-cbl for Casitas B-lineage lymphoma.
 Draft entry and computer-readable sequence for [1] kindly submitted by W.Y.Langdon, 02-MAR-1989. Cas NS-1 is an acutely transforming murine retrovitus that induces pre-B and pro-B cell lymphomas. It was generated from the ecotropic Cas-Br-M virus by sequential

 U10414 28990 bp DNA linear INV Caenorhabditis elegans cosmid F42A10, complete sequence
 This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemis or covered by high quality data (i.e., phred quality -30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence f more than one ml3 subclone.

Seq_documentation_block:
LOCUS CEF11C1
 available information.

Current sequence finishing criteria for the C. elegans genome sequencing consortium are that all bases are either sequenced unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones. Exceptions are indicated by an explicit note.

This sequence is the entire insert of clone FIIC1. The start of this sequence (1. 104) overlaps with the end of sequence ALO23817. The end of this sequence (40749. .40852) overlaps with the start of
 Submitted (29-SEP-1995) Nematode Sequencing Project, Sanger Institute, Hinxton, Cambridge CBIO 15A, England and Department of Genetics, Washington University, St. Louis, Mo 63110, USA. E-mail: jes@sanger.ac.uk or rw@nematode.wustl.edu on Sep 22, 1998 this sequence version replaced gi:1001858. Coding sequences below are predicted from computer analysis, using predictions from Genefinder (P. Green, U. Washington), and other
 the specified clone. It may be shorter proverlapping sections once, or longer because overlap between neighbouring submissions.
 For a graphical representation of this sequence and its analysis see: http://wormbase.sanger.ac.uk/perl/ace/elegans/seq/sequence?

* NOTE: Estimated insert size may differ from sequence length

* (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

* NOTE: This is a 'working draft' sequence. It currently

* CONSISTS of 48 contigs. The true order of the pieces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.

 requests: clonerequestesanger.ac.uk
On Oct 17, 2000 this sequence version replaced gi:10732514.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.
The following abbreviations are used to associate primary accession
numbers given in the feature table with their source databases:
Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information
on the WORMPEP database can be found at
http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence
was generated from part of bacterial clone contigs of human
chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping
Group. Further information can be found at
 IMPORTANT: This sequence is not the entire insert of clone RP1-223E3 IT may be shorter because we sequence overlapping sections only once, except for a 100 base overlap. The true left end of clone RP1-223E3 is at 1 in this sequence. true left end of clone RP1-220N9 is at 59522 in this sequence. Location/Qualifiers
 http://www.sanger.ac.uk/HGP/Chr6
This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. RPI-22B3 is from the sementary RPCI-1 constructed by the group of Pieter de Jong. For further details see
 Submitted (13-MAR-2001) Sanger Centre, Hinxton, Cambridgeshire, CB10 1SA, UK. E-mail enquiries: humquery@sanger.ac.uk Clone

 A composite (incomplete) nucleotide sequence (AAT42753) and putative translation (AAW08145) sequence are provided of a motif that is found spliced to the 3' end of chicken CHD-W clone CCl4 (see also AAT42754). There are no splice donor or acceptor sites within the motif suggesting it is a final rather than an intermediary product of splicing. The motif is also found as an insert in some CHD-lA clones (see also AAT42752).
 Avian chromodomain-helicase-DNA binding genes determine sex birds - used for sex determn. and to control sex of progeny

 A composite nucleotide sequence (AAT42752) and putative translation (AAW08144) sequence are provided of a motif that is found spliced to a proportion of chicken CHD-1A clones. The motif is inserted between bases 4327 and 4328 of the CHD-1A composite sequence (AAT42751). None of the 7 CHD-1 clones examined contained the
 complete motif. There are no splice donor or acceptor sites within the motif suggesting it is a final rather than an intermediary product of splicing. The motif is also found at the 3' end of the CHD-W clone CC14 (see also AAT42753).

 The invention relates to isolated nucleic acid molecules encoding cover human secreted extracellular matrix proteins (SPs). The polynucleotides and proteins are used to prevent, treat a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. For example, disorders associated with decreased condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. For example, disorders associated with decreased condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. For example, disorders associated with decreased conditions are pression of SPs by binding with the sex polynucleotide or a vector expressing them may be administered to down regulate expression. The polynucleotides can any also be used as DNA probes in diagnostic assays. The SPs may also be used as antiquens to produce antibodies and to identify modulators can an antagonists may also be used to down regulate expression and activity of antagonists may also be used to down regulate expression and activity of the disorders include for example: immune/autoimmune diseases (e.g. HIV conditions and activity of the disorders include for example: immune/autoimmune diseases (e.g. HIV conditions) and activity of the disorders include for example: infections, anaemia, rhewnatoid arthritis and multiple sclerosis), cancers and hyperproliferative disorders (e.g. cardiac and multiple sclerosis) cancers and hyperproliferative disorders (e.g. arrest, tachycardia and angina), infections caused by bacteria, viruses and fingl and ocular disorders (e.g. corneal infections). Other uses can fully and ocular disorders (e.g. corneal infections). Other uses and include wound healing, maintenance of organs before transplantation,

 The present invention provides the protein and coding sequences of number of human digestive system antigens. These can be used in this diagnosis, treatment and prevention of digestive system disorders, including cancer, Meckel's diverticulum, bacterial or parasitic infections, appendicitis, Hirschsprung's disease, chronic colitis ulcerative colitis. The present sequence is a genomic DNA fragment encoding a digestive system antigen of the invention.
 Polynucleotides encoding digestive system antigens, useful for diagnosing, treating, preventing and/or prognozing disorders of the digestive system, particularly cancer and cancer metastases -

 The present sequence is one of a large number of 5′ ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5′ ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3′ untranslated region (UTR) of the mRNAs because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5′ ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5′ UTR is rarely included. 5′ ESTs are derived from mRNAs with intact 5′ ends and can therefore be used to obtain full length cDNAs with intact 5′ ends and can therefore be used to obtain full length cDNAs with intact 5′ ends and can therefore be a used to obtain upstream regulatory sequences and to design expression and secretion vectors.

 amino acid sequences given in AAM82170 to AAM91221. (1) have cytostatic CC activity, and can be used in gene therapy and vaccine production. (1) CC proteins and polynucleotides may be used in the prevention, diagnosis and CC treatment of diseases associated with inappropriate (I) expression. For C example, they may be used to treat disorders associated with decreased CC expression by rectifying mutations or deletions in a patient's genome CC that affect the activity of (I) by expressing inactive proteins or to CC supplement the patients own production of (I). Additionally, (I) of CC polynucleotides may be used to produce the secreted (I), by inserting CC protein. (I) proteins and polynucleotides may be used to produce the secreted (I), by inserting CC diagnose and treat immune/haematopoietic-related diseases, especially CC cancers and cancer metastases of haematopoietic-derived cells. AAK64703 CC cancers and concer metastases of haematopoietic-derived cells. AAK64703 CC sequences from the present invention. AAK34942 to AAK34950 and AAM82169 CC represent sequences used in the exemplification of the present invention.

 The invention relates to new polynucleotides and polypeptides, useful for diagnosis and treatment of breast, lung and colon cancer. The sequences can be used in detecting differentially expressed genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample derived from a cell suspected of being cancerous. They can also be used to Inhibit tumour growth by modulating expression of a gene product. AAS35943 represent novel human diagnostic and therapeutic coding sequences of the invention.
The present invention describes a method for monitoring differential

 CC expression of genes in a first filamentous fungal (FF) cell relative to CC expression of the same genes in one or more second filamentous fungal CC cells. The method uses filorescence-labeled nucleic acids isolated from CC the FF cells and a substrate of expressed sequence tags (EET). The ESTS CC are used in the methods for monitoring differential expression of genes CC in a first filamentous fungal (FF) cell relative to expression of the CC same genes in one or more second filamentous fungal cells. Monitoring CC the global expression of genes from FF cells allows the production CC discovered, possible functions of unknown open reading frames can be CC discovered, possible functions of unknown open reading frames can be CC discovered. The expression of genes can be used to study how FF cells adapt to changes in culture conditions, environmental stress, spore CC morphogenesis, recombination, metabolic or catabolic pathway CC engineering. Using ESTs provides several advantages over genomic or CC random cDNA clones including elimination of redundancy as one spot on an CC array equals one gene or open reading frame, and organisation of the CC microarrays based on function of the gene products to facilitate consists of the results. AAF11248 to AAF11247 represents ESTs from Aspergillus of CC AAF14879 to AAF1337 represents ESTs from Aspergillus oryzae; and CC AAF14879 to AAF1337 represents ESTs from Trichoderma reesei, which are CC all specifically claimed in the present invention.

 The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. An OFF has been identified within the sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.

 13-MAR-2001
The present invention describes a method for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative
 Monitoring differential expression of genes in filamentous fungal uses fluorescence-labeled nucleic acids isolated from the cells ausubstrate of expressed sequence tags -

 CC expression of the same genes in one or more second filamentous fungal CC cells. The method uses fluorescence-labeled nucleic acids isolated from CC the FF cells and a substrate of expressed sequence tags (EST). The ESTS CC are used in the methods for monitoring differential expression of genes CC in a first filamentous fungal (FF) cell relative to expression of the CC same genes in one or more second filamentous fungal cells. Monitoring CC the global expression of genes from FF cells allows the production CC potential of the microorganisms to be improved. New genes may be CC discovered, possible functions of unknown open reading frames can be cidentified and gene copy number variation and stability can be consisted in culture conditions, environmental stress, spore consisted in culture several advantages over genomic or cardom cDNA clones including elimination of redundancy as one spot on an array equals one gene or open reading frame, and organisation of the carray equals one function of the gene products to facilitate consists of the results. AAF07478 to AAF11247 represents ESTs from CC analysis of the results. AAF07478 to AAF11247 represents ESTs from Aspergillus organes; AAF11854 to AAF11878 represents ESTs from Trichoderma reesei, which are CC all specifically claimed in the present invention.

CC This polynucleotide sequence represents the DNA of the atRSp41 5'-UTR.
CC The invention relates to novel DNA sequences that function as promoters
CC of transcription of associated nucleotide sequences in plants. The
CC invention provides a DNA sequence capable of driving expression of an
CC associated nucleotide sequence, wherein said DNA sequence is obtainable
CC from genes of the atRSp (Arabidopsis thaliana arginine/serine-type plant
CC DNA molecules comprising an atRSp41 promoter, the invention also provides
CC expression vectors and transgenic plants comprising the promoters of the
CC invention. The DNA sequence of the invention is useful for expressing a
CC nucleotide sequence of interest. The nucleotide sequences proteins
CC for conferring a desirable phenotypic trait to a plant transformed with
CC the protein, where such traits include antibiotic resistance, virus
CC resistance, insect resistance, disease resistance, or resistance, virus
CC pests, herbicide tolerance, improved nutritional value, improved
CC performance in an industrial process or altered reproductive capability.

for anti-cancer agents

The invention relates to novel genes (AAI93926-AAI97963) expressed in human neuroblastoma. The nucleic acids are applicable as a probe or primer in diagnosing the prognosis of human neuroblastoma, malignancy and susceptibility indicators or tumour markers for anti-cancer agents. The gene information for diagnosing prognosis is related to factors similar to that for N-myc and TrkA genes.

//notes Nector: lambdaZAP; Site_1: EcoRI; Site_2: Xhol; /notes Nector: lambdaZAP; Site_1: EcoRI; Site_2: Xhol; Seeds were surface sterilized then germinated under axenic conditions in the dark at room temperature on filtrer paper with water, nystatin and cefotaxime in covered crystallization dishes. Five-day old seedling shoots were then harvested, total RNA was prepared, poly(A) RNA was purified, one primary unamplified cDNA library was made, and 1 million pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids. These steps were performed in the TJ close laboratory at the University of California, Riverside (Choi, Close, Fenton). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or above. For more details on library preparation and sequence analysis see http://www.genome.clemson.edu/orders Also see Close TJ, Wing R, Kleinhofs A, Wise R (2001)

 XhoI; Plants were grown in an aeroponic chamber on nitrogen-rich medium for 21 days. Three days before inoculation with Sinorhizobium meliloti, the medium was replaced by N-free medium. Root nodules (+ short adjacent root segments) were harvested 4 days post inoculation. CDNA was prepared from polyA+ enriched RNA. The CDNA was directionally ligated into Uni-zap XR vector from Stratagene and packaged using Gigapack Gold packaging extracts. Plasmids containing CDNA inserts were
 mass-excised from phage stocks using ExAssit helper phage and propagated in SOLR cells. Clone ordering and sequencing was performed by the Centre National de Sequencage (Genoscope, Evry, France)."
